Introduction

After reviewing the previous version of my Rosebank Tech Support website, there were some elements that needed improvement. The structure of the website was not ideal, there were some issues with the HTML code, some of the links were not working, and some did not lead to the correct pages, among others. I therefore decided to make changes aimed at improving the structure, aesthetics, functionality, and usability of the website. Some of the other changes included enhancing the Contact Us, Services, and Frequently Asked Questions pages. Some of the enhancements included making the website navigable, responsive, stylish, functional, and interactive. The aim of these changes was to make the website easy to navigate, professional, device friendly, and easy to manage.

Website Improvements and Benefits

Improved HTML Structure

One of the improvements that I have made is organising the structure of the HTML code. Some of the HTML tags in my previous HTML code had been improperly closed, while other elements were placed in the wrong order. Some of the "<nav>" and "<header>" tags, for instance, were improperly closed. I made corrections and organized the HTML code using appropriate HTML5 tags such as "<header>", "<nav>", "<main>", "<section>", and "<footer>". I have also used the appropriate "DOCTYPE" declaration and the "lang="en"" attributes. Organising the structure of a website makes it easy to understand and read by the browser. The organized structure will be helpful to me when maintaining and updating the website.

Improved Navigation Menu

The navigation menu was enhanced through the inclusion of links to all essential pages on the website. Some of the links included in the old code were not correctly written; for example, the "Contact Us" link did not point to any HTML page. In the new code, I have made sure that the navigation menu contains links to such pages as "Index", "Home", "About Us", "Services", "Gallery", "FAQ", "Contact Us", and "Form". These changes facilitate easy movement from one page to another within the site. A well-

written navigation menu enables users to access relevant information without going back to the home page.

Added a Viewport Meta Tag

Viewport meta tag was included in the recent version of the site. There was no viewport tag in the old code of the website. The importance of this tag is its ability to ensure responsiveness of the webpage and adjust the layout depending on the screen of the device, which is used. It is important because users can access the website from a personal computer, laptop, tablet, or even smartphone. Without the viewport settings, the webpage will not be shown correctly on the small screen. Inclusion of the tag increases the responsiveness of the website and ensures correct view of the content in any case.

Better Responsive Design

By improving the design of the website with responsive CSS, especially the Contact Us page, I used the media query to transform the two-column contacts into one column when the screen gets smaller. This way, the contact details and the contact form will fit into a smaller screen, such as a mobile phone or a tablet. The advantage of this is that users will not have to zoom and scroll left and right to see the content of the page. In addition, responsive design increases accessibility for users with different gadgets.

Improvement of the Contact Us Page

This page has been improved significantly compared to the previous version. First, it has a page heading that explains to the user that the support team is there to assist with their tech problems. Secondly, the contacts are more elaborate in that the email address, phone number, location, and working hours are provided. Thus, if a user wants to get in touch with the support team, he/she will have enough information to do so.

Improved the Contact Form

The contact form has been improved through the addition of various fields to enable users to add the required information by the support team. The fields include the user’s full name, email address, subject, and message. Additionally, the "required" field attribute has been used to ensure that the user does not submit the form without providing crucial details. This enhancement enables the support team to obtain clear information about the user’s issue and enhances the reporting process of the technical issue.

Added Better Form Styling

Form styling has been achieved through the application of CSS styles to improve the appearance of the form. The input fields and text area have been designed to fit within appropriate sizes in terms of width, padding, border, and round corners. In addition, the Send Message button

has been designed to clearly differentiate from other parts of the form. The button's design changes according to mouse hovering on it.

Enhanced Website Colour Scheme

To enhance the website colour scheme, I will use the colours that are in line with the Rosebank Tech Support colour theme. These colours include blue, white, and gray. Blue colours can be used for the headings, buttons, and navigation bar whereas white can be used for the main content area. Grey can be used for background and other additional features. Using similar colours on all the web pages will ensure consistency within the website pages. The website will become more professional and organized.

Introduction of Cards and Improved Layout

The layout of the various sections of the web page can be improved through the introduction of containers, cards, spacing, border, and shadows. In the case of the Contact Us page, the layout will have different sections containing contact details and the contact form. The Service page will also have service cards for each of the services. This will make it easier to read the information because the users will be able to easily identify the sections.

Bettered the Footer

Instead of an empty footer or an incorrect copyright code, I put up a footer which will contain information about the website and its name, as well as the slogan "Reliable • Secure • Connected". A footer is an effective way to provide the website with more completeness and professionalism. Users will also get some useful information from the footer which will be situated at the bottom of each page.

Bettered the Services Page

The Services page has been bettered through organizing several types of technical support services in various paragraphs. These are Computer Support, Network Support, Account and Password Support, Email Support, Student Support, and Software Support. There is a description of the service as well as assistance provided. This will make it easier for users to know what Rosebank Tech Support provides them with and in a more professional manner than writing it all in one large paragraph.

Improvement in FAQ Page

The improvement done on the FAQ page included questions related to technical support that the users may have. These questions include such things as forgetting passwords, wireless connection issues, technical support requests, technical issues, services offered, support hours, response time, and software issues, among others. To achieve this improvement, I have incorporated the use of "

" and "" tags. In this way, the user can click on any question, and its answer will pop up in the web page without messing up the whole page with information.
JavaScript Functionality

To enhance interactivity on the website, I have included JavaScript on the site. For example, when one submits the information through the contact form, they get an immediate confirmation message that their information has been received. In the future, JavaScript can be used in other parts of the website, like validating form contents, making interactive buttons, and other functionalities of the website instead of being static.

Fixing Broken Links and Coding Mistakes

Fixing mistakes and incomplete links in the old code was another improvement. In the previous version, there were some links without proper ".html" file name extension, and some HTML codes had no closing brackets. These mistakes have been fixed in the updated version. It is essential to fix these mistakes since broken links may hinder users from accessing the page. The correction of coding mistakes will increase the reliability of the website and minimize problems with opening the website in the web browser.

Improvements to Website Accessibility

Improvements aimed at making the website accessible to users have also been made. I have made use of alt-text for images and form field labels. Proper headings and well-structured sections can also facilitate website navigation and help users better understand the content.
The design and layout of the website have been made uniform by making changes to the structure and layout of the pages. Using the same logo, navigation menu, colors, fonts, buttons, and footer elements will give a consistent look and feel to the entire website. Consistency is important because users will be able to tell that they are still navigating the same website when moving from one page to another. It will also give the website a more professional look and help in maintaining it.

Overall Benefits of the Improvements

The new Rosebank Tech Support website has been improved in terms of organization, professionalism, usability, and responsiveness. The improvements in HTML structure have made the website easier to understand and maintain. The improvements in CSS have made the website visually appealing and professional. Improved navigation and responsive design have made the website easier to use. Improved contact us form and page allow users to request technical assistance easily and quickly. The FAQ page and services page contain information that is valuable for users of Rosebank Tech Support. Adding JavaScript allows for additional interactivity and feedback options. All these improvements have enabled me to create a better website.
